

Apartment Wi-Fi Manager

Complete Step-by-Step Setup & Operational User Guide

1 First-Time Connection Setup

When you open the web application link, a **Connect to Backend** modal will pop up automatically.

1. Open the website URL provided by the host (e.g., `https://your-app.vercel.app`).
2. Fill in the connection form:
 - **Backend URL:** `https://xxxx.ngrok-free.dev` *(provided by host)*
 - **API Key:** `your-api-key` *(provided by host)*
3. Click **Connect & Save**.

💡 **Note:** Your browser saves these settings automatically in `localStorage` , so you only need to complete this step once per browser.

2 Router Setup (One-Time)

Before syncing devices, configure the Skyworth router credentials in the app:

1. Click the ⚙️ **Settings** icon in the top navigation bar.
2. Enter the router details:
 - **Router IP Address:** Default is usually `192.168.1.1`
 - **Router Username:** Default is usually `admin`
 - **Router Password:** Enter the admin password for the router
3. Click **Save Settings**.

⚠️ CRITICAL: DO NOT LOCK YOURSELF OUT!

If your laptop or phone connects to the router over **Wi-Fi** (instead of an Ethernet cable), turning on MAC Filtering / Allow List mode will **block your own device** unless its MAC address is registered first!

To avoid getting locked out:

1. **Register Admin Devices First:** Add your laptop's MAC address and your friend's phone/laptop MAC address into the Wi-Fi Manager app under an "Admin / Management" room or tenant.
2. **Keep Admin Devices Active:** Ensure the toggle for admin devices remains **ON** at all times.
3. **LAN Cable Backup:** Connecting your laptop to the router using an Ethernet / LAN cable bypasses Wi-Fi MAC filtering, giving you guaranteed access.

3 Managing Rooms, Tenants & Devices

A. Adding a Room

Click **+ Add Room** at the top of the dashboard. Enter the **Room Number** (e.g. `Room 101`) and max person capacity, then click **Create Room**.

B. Adding a Tenant

Locate the room card on the dashboard and click **+ Add Tenant**. Enter the tenant's full name (e.g. `John Doe`) and max allowed devices, then click **Add Tenant**.

C. Registering a Device

Under the tenant's profile, click **+ Add Device**. Enter a **Device Name** (e.g. `John's iPhone`) and its **MAC Address** (format: `AA:BB:CC:DD:EE:FF` or `AABBCCDDEEFF`).

✦ How tenants find their MAC Address:

- **iOS / iPhone:** Settings → General → About → *Wi-Fi Address* (Turn off "Private Wi-Fi Address" for apartment network).
- **Android:** Settings → About Phone → Status → *Wi-Fi MAC Address*.
- **Windows:** Settings → Network & Internet → Wi-Fi → Hardware properties → *Physical address (MAC)*.

4 Activating, Blocking & Syncing Wi-Fi Access

- **Granting Access:** Ensure both Tenant and Device toggles are turned **ON**.
- **Revoking Access:** Switch the Tenant or Device toggle to **OFF**.
- **Syncing to Router:** Whenever you add, remove, or toggle devices, click the ⚡ **Sync to Router** button in the top menu to push changes directly to the router.

🔧 Fallback: Manual Router MAC Filtering (If Auto-Sync Fails)

If automated sync cannot connect to the router, manage access manually via the router web admin page:

1. Connect to the apartment Wi-Fi and open `http://192.168.1.1` in a web browser.

2. Log in using the admin credentials printed on the router sticker.
3. Navigate to **Security** → **MAC Filter / Access Control (ACL)**.
4. Set **Filter Mode** to **Allow List (White List)**.
5. Copy MAC addresses from the Wi-Fi Manager app, paste into the router's **Allow List**, and click **Apply / Save**.
